VitalTwin — System Architecture

Educational digital twin prototype | High-level data flow

Input	Processing	Twin engine	Output
User-entered wellness profile	Normalization and bounded component scores	Transparent weighted rule-based calculation	Wellness index + component breakdown
Hypothetical intervention sliders	Recalculate modified profile	Same deterministic scoring function	Before/after scenario comparison
Generated synthetic time series	Deterministic illustrative data	No external patient records	Trend visualization

Safety boundary: The prototype is not a medical device, does not diagnose disease, and does not provide validated clinical predictions. All trends are synthetic and illustrative.

No authentication, external integrations, or real patient data storage are included in this MVP.
